

ENERGY SUPPLY TARIFF ADDENDUM

Northline Components Plant 4 - Compressed-Air Energy Review

Addendum reference: ES-ADD-2026-04-NCP4

Effective date: 01 April 2026

Status: Signed and controlling for consumption on and after the effective date

1. Purpose

This signed addendum replaces the working electricity-rate assumption previously used in internal facilities spreadsheets for Northline Components Plant 4. For compressed-air energy modelling and retrofit screening, apply the tariff below to annual electrical consumption calculated in kilowatt-hours.

Tariff component	Controlling value	Application
All-in electricity energy rate	GBP 0.134 per kWh	Apply to modelled annual compressed-air electrical consumption.
Previous working assumption	GBP 0.112 per kWh	Superseded. Do not use for current retrofit decisions.
Effective period	From 01 April 2026	Use for the current capital-screening exercise.

2. Application Note

Annual compressed-air electricity cost must be calculated as annual compressed-air electrical consumption multiplied by GBP 0.134 per kWh. Any comparison that retains GBP 0.112 per kWh is a stale draft and must be corrected.
